

Abstract of the Disclosure:

A connector comprises contact pins, an insulator and a  
5 supplementary insulator. Each of the contact pins comprises a supported  
portion and a contact end. The insulator comprises accommodation  
portions which accommodate the respective contact pins. Each of the  
accommodation portions is provided with a supporting portion which  
includes a supporting surface and supports the supported portion of the  
10 corresponding contact pin. The supplementary insulator is fixedly held by  
the insulator. At least one part of the supported portion of the contact pin  
is placed between the supporting surface and the supplementary insulator in  
a Z-direction. Therefore, the supported portion always straightly extends  
in a Y-direction so that the contact end can be surely positioned at a  
15 predetermined position.
